

Squaring the data-flow circle: One vision from disparate data

Esther Hughes
esthug@mba.ac.uk

“A learned society advancing marine science through research, communication and education”

www.mba.ac.uk

A wide-angle photograph of a coastal scene. In the foreground, a sandy beach curves from the bottom left towards the center. The water is exceptionally clear, showing a vibrant turquoise color near the shore that deepens into a darker blue further out. A line of dark, possibly seaweed or rocks, is visible just beyond the shallow water. In the background, a rugged, rocky coastline stretches across the horizon under a vast, clear blue sky. The overall atmosphere is serene and natural.

'Use available data' is a frequent requirement when asked to prepare an environmental statement. In this article, I suggest areas where we can improve our use of existing data or information to answer some current environmental protection and management questions but I also draw attention to areas where targeted research and acquisition of new field data is required. I counsel those who commission work not to expect too much of available information and to ensure that properly managed field investigations and experimental studies continue to be undertaken. © 1997 Elsevier Science Ltd. All rights reserved.

Using Available Data

bring together available literature or on analyzing raw data can provide the necessary information on which to decide each feature as biologically characterizing. Existing efforts of advisors and biologically community organizations have been reviewed in the 1982 Environmental Statement. The more wide-ranging of these sets of statements are the Quality Status Reports (QSRs) requested under the 1982 Convention for the Protection of the Marine Environment of the Eastern African. A characteristic of such a marine environmental assessment is that it is a compilation of current knowledge about a defined area (QSRs for the East African, Onyiah 1986). The QSRs are the subsidiary body on Scientific, Technical and Technological Advice to the Commission of Parties to the Convention on Biological Diversity have estimated the QSRs as "a synthesis of the available knowledge and resources" using low-cost methods including existing data research to upgrade existing data (GONZALEZ 1986). QSRs are not intended to be a replacement for field work; in no time to undertake field work and subsequent statistical analysis; it may also be because low financial resources prevent adequate acquisition of field data. Whereas, the QSRs are not intended to be a replacement for field work, they are intended to be a sufficient relevant data available. The assumption, in hope, that relevant and good quality data will exist

always use available information where it is adequate
we must also take action to fill the gaps.

How 'Available' is Data?

Obviously, using available data only works where data relevant to the question being asked in the analysis under consideration has already been collected and made importantly, is available. Broad summary descriptions of the UK's marine environment are available from a number of sources. The UK is published in documents such as the annual State of Assessment Reports contributing to the annual assessment North Sea GSR (North Sea Task Force, 1998) and, for northwestern areas of the UK, the Coastal Zone Management Plan (CZMP) (Scottish Natural Heritage, 1997). Other useful information can be found in the Conservation Committee (most recently, Burns et al., 1998). Sources for more detailed descriptions of the marine biology of particular locations and systems are available from the Marine Biological Association of the United Kingdom's Digital Marine Atlas Project (SUMAMAP), based on information reviews undertaken by the Marine Nature Conservation Review (MNCRR). Raw data are more difficult to obtain as it is often held confidentially or is too large to publish. However, the International Council for the Exploration of the Sea (ICES) Inshore survey for the North Sea, MNCRR and country nature conservation agency surveys provide some offshore areas of Great Britain. However, there are significant gaps in coverage and the data are often incomplete and of approximate quality to the sort of questionnaire

In the age of the World Wide Web and of freedom of information, of government openness and so on, how available is information? For instance, in the Netherlands, oil companies have spent hundreds of thousands of pounds on hostile surveys in oil fields. The surveys are aimed at environmental protection and management and some companies will make data freely available. Others, understandably, may wish to recover some of the cost of survey and sell data. Others, perhaps where engineers are calling the shots, could adopt an approach which suggests possible competitive advantage.

The screenshot shows a portion of the Defra website. At the top, there is a green header with the URL www.defra.gov.uk. Below this, the main content area has a light green background. The heading 'Charting Progress' is displayed in a large, dark font. Underneath it, the subtitle 'An Integrated Assessment of the State of UK Seas' is written in a smaller, dark font. At the bottom of the visible area, there are two small, partially visible images: one showing a map of the UK and another showing a satellite view of the sea.

Metadata: 2010 NERC Sea Mammal Research Unit. Berwickshire and North Northumberland Grey seal population status

Overview

Abstract: As part of a report to Natural England, the NERC Sea Mammal Research Unit conduct and investigation into the Grey Seal population status of Berwickshire and North Northumberland Coast European Marine Site. The report includes detailed counts of grey seals around various known populations along the site of interest. These totals are compared with previous studies estimate pup production rate and breeding potential for each population.

Data holder: Natural England

Online resource present: 

Use constraints:

- Accessible under NE and DASSH terms and conditions
